Microsoft Enterprise Desktop Virtualization (MED-V) enhances deployment and management of Virtual PC images on a Windows Desktop, while also providing a seamless user experience of a Virtual PC environment, independent of the local desktop configuration and operating system (OS). MED-V leverages Microsoft Virtual PC to provide an enterprise solution for desktop virtualization. With MED-V, you can easily create, deliver and manage corporate Virtual PC images on any Windows desktop. Microsoft Enterprise Desktop Virtualization is an integral component of the Microsoft Desktop Optimization Pack (aka MDOP), a dynamic solution available to Software Assurance customers, which will help reduce application deployment costs, enables delivery of applications as services, and helps to better manage and control enterprise desktop environments. Enable legacy applications and accelerate upgrades to new operating systems. Incompatibility of legacy applications with the new version of Microsoft Windows can often delay enterprise upgrades to the latest version of Windows. Testing and migrating applications can take a while, and users are unable to take advantage of the new capabilities and enhancements offered by the new OS. By delivering applications in a Virtual PC that runs a previous version of the OS (e.g., Windows XP or Windows 2000), MED-V removes the barriers to OS upgrades, and allows administrators to complete testing and to deal with incompatible applications after the upgrade. From the user's perspective, these applications are accessible from the standard desktop Start menu and appear side-by-side with native applications - so there is minimal change to the user experience. Known Issues:

- File downloads do not follow web redirection rules.
- If the LAN adapter is disabled when a Workspace configured in bridge mode is started, and the adapter is later enabled, the network will not resume. Restarting the Workspace solves this issue.
- Workspace image download may be delayed if Windows update is running when it is started.
- When the user is required to change his domain password in order to login to Windows inside the Workspace, the client receives a notification about using the wrong username/password, rather than a notification that he should change his domain password.
- When expanding a DOS application (e.g. cmd.exe) window to full screen, the application window disappears.
- When the domain password is changed while the Workspace is running, and the Workspace is restarted, a wrong password notification appears on the client and the user is required to re-enter the new password.
- When installing MED-V using the command line, it is

Microsoft Enterprise Desktop Virtualization is a virtualization software solution which delivers a virtual PC desktop inside a Virtual Machine (VM). A user works in the virtual desktop just as in a real machine, but the underlying physical hardware remains the same. By deploying VPC inside the Virtual Machine, MED-V extends the life of physical hardware while providing the user with a desktop and a real Windows interface. In addition, by using Shared VMs (see example below), users do not need to install and maintain individual virtual desktops for each user. The key features of the Microsoft Enterprise Desktop Virtualization solution are:

- Smooth user experience - users can boot a Desktop and run their favorite applications just as they would if they had physical access to the desktop.
- Legacy application support - work with old applications, versions or platforms because they all run in a virtual desktop as if it were a real physical machine.
- Running local installations - leveraging Microsoft Virtual PC and using Remote Desktop Connection, users can also run native applications from physical computers on a local network.
- Zero application deployment time - the virtual desktop image can be created as a package, or a scripting solution can be used to create a binary executable installer, and then deployed on an entire environment.
- Workspace-based deployment - multiple Workspaces can be installed on a single host, and configured to run simultaneously.

Workspaces can be easily managed from a central console, and be scaled up or down to meet the workload. · Share-based deployment - the target virtual machine is a shared file server, which allows two or more users to use the same virtual desktop instead of having to install virtual machines on each user's machine. Features of MED-V · Designed to run a Virtual PC environment with Virtual machines operating on top of it - a virtual computer environment where multiple operating systems can run side by side. · Runs as a standard Windows user interface desktop session - a virtual desktop within a Virtual Machine which runs just as if it were a real physical machine. It works exactly like Windows 7. · Supports both legacy applications and new operating systems - can be used on any Windows operating system. VPC is not affected by Windows update. · Can run both native and legacy applications - applications that can run on Windows XP or Windows 2000 or Windows 7 can be run in MED-V. · Can be managed from a command line or an interactive desktop - administrators can create and deploy Virtual Machine images, manage the Microsoft Virtual Machine Manager console, or work interact
